RESEARCH INTERESTS      I wish to understand the foundations of learning and decision making towards developing intelligent systems. I often (1) take a probabilistic approach; (2) care about automatically discovering scientifically interpretable structure in data; and (3) am excited about bridging connections with scientific computing. I am particularly active in building methods for probabilistic deep learning, scalable Gaussian processes, kernel learning, and training of deep neural networks. My work has been applied to time series, vision, NLP, spatial statistics, public policy, medicine, and physics. I believe in open and reproducible research.

- EMPLOYMENT     **Microsoft Research**, Cambridge, UK     **07/2012 – 09/2012**  
*Research Intern, Supervisor: Sebastian Nowozin*
- I developed Bayesian inference techniques, and new Bayesian nonparametric models, for NMR spectroscopy. These new machine learning techniques can be used to make predictions about chemical concentrations and the progress of chemical reactions, and are markedly different from conventional NMR spectroscopy techniques.
- TRIUMF**, Vancouver, Canada     **09/2007 – 08/2008**  
*Researcher, Supervisor: Douglas Bryman*
- Positron Emission Tomography (PET) is used to visualise functional activity, as opposed to anatomical structure; for example, it can be used to trace thought processes. At TRIUMF, the world's largest cyclotron laboratory, I independently devised image reconstruction algorithms necessary for the operation of a groundbreaking new PET device.
- University of British Columbia**, Vancouver, Canada     **05/2007 – 08/2007**  
*Teaching Assistant, Mathematics Department*
- I was the teaching assistant for a third year class in partial differential equations. I graded approximately 70 assignments weekly, and gave tutorial lectures twice weekly, where I derived theorems and explained concepts. I also tutored individuals and groups, and helped students with test preparation.
- University of British Columbia**, Vancouver, Canada     **05/2006 – 08/2006**  
*Researcher, Physics Department, Supervisor: Matthew Choptuik*
- I worked on developing a scientific programming language. I wrote a grammar and a parser to interpret the rules of the language. The language numerically solves partial differential equations, given the equations and the boundary conditions. The language also generates C and Fortran solution templates, and animated visualizations of the solution. I used C, Fortran, Perl, Flex (Lex), Bison (Yacc), tcsh and bash. The project consisted of 182 sources written in these languages. I also worked on a code-driver, using Perl, to generate fully functioning C and Fortran programs from a small number of declarations in an input file. This work was motivated to assist in using general relativity to model physical problems.
- Misc     I am a classically trained pianist. I particularly like Glenn Gould's playing of Bach. I also enjoy reading about modern physics, and writing essays.
