## ORIE 6300 Mathematical Programming I

## Problem Set 3

Due Date: September 26, 2008

1. Give an example of a primal-dual pair for which both the primal and dual are infeasible, and demonstrate that they are infeasible. Use a matrix $A \in \Re^{1 \times 1}$.
2. Suppose that $P^{i}=\left\{x \geq 0: A^{i} x=b^{i}\right\}$ for $i=1,2$ are both bounded.

Prove that $P=P^{1}+P^{2}$ is also a polytope, where $P^{1}+P^{2}=\left\{x^{1}+x^{2}: x^{1} \in P^{1}\right.$ and $\left.x^{2} \in P^{2}\right\}$.
3. Consider the set $P=\{x: A x \geq 0\}$ and assume that we have $x \geq 0$ for all $x \in P$, i.e., that $x \geq 0$ is implied by $A x \geq 0$.
(a) A set $K$ is a cone if $x, y \in K$ implies that $\lambda x+\mu y \in K$ for all $\mu, \lambda \geq 0$. Prove that $P$ is a cone.
(b) An extreme ray of a cone $K$ is a nonzero vector $x \in K$ such that $x+y \in K$ and $x-y \in K$ implies that $y=\lambda x$ for some $\lambda$.
Give another characterization of the extreme rays of the polyhedral cone $P$, using the rank of a submatrix of $A$. (Hint: think about the positive orthant as the canonical example of a cone, in order to get some intuition here.)
(c) Two extreme rays $x$ and $y$ of a cone $K$ are said to be the same if $x=\lambda y$ for some $\lambda>0$. Prove that the number of different extreme rays of our polyhedral cone $P$ is finite. Give a finite bound on the maximum number of extreme rays possible assuming that $A$ is has $m$ rows and $n$ columns.
(d) Let $r^{1}, \ldots, r^{k}$ denote the finite set of extreme rays of $P$. Let

$$
Q=\operatorname{cone}\left(r^{1}, \ldots, r^{k}\right)=\left\{x=\sum_{i} \lambda_{i} r^{i}: \lambda_{i} \geq 0 \text { for all } i\right\} .
$$

Prove that $P=Q$. (Hint: consider $P^{\prime}=\left\{x \in P: \sum x_{i}=1\right\}$.)
It might help to visualize this as moving from the description of $P$ by the faces of the cone that bound it ( $A x \geq 0$ ) to a description of $P$ by the outside rays $\left(r^{1}, \ldots, r^{k}\right)$ that bound it.
4. (a) Given a convex cone $K \subseteq \Re^{n}$, prove that the polar of $K$ is the set $\left\{z \in \Re^{n}: x^{T} z \leq\right.$ 0 for all $x \in K\}$.
(b) Give the polar of the non-negative orthant $\left\{x \in \Re^{n}: x \geq 0\right\}$.
